

XML Transformer with Business Rules - SAP Integration Suite

Objective

Read XML, apply business rules, rebuild XML using MarkupBuilder, log payloads and return transformed XML.

Integration Flow

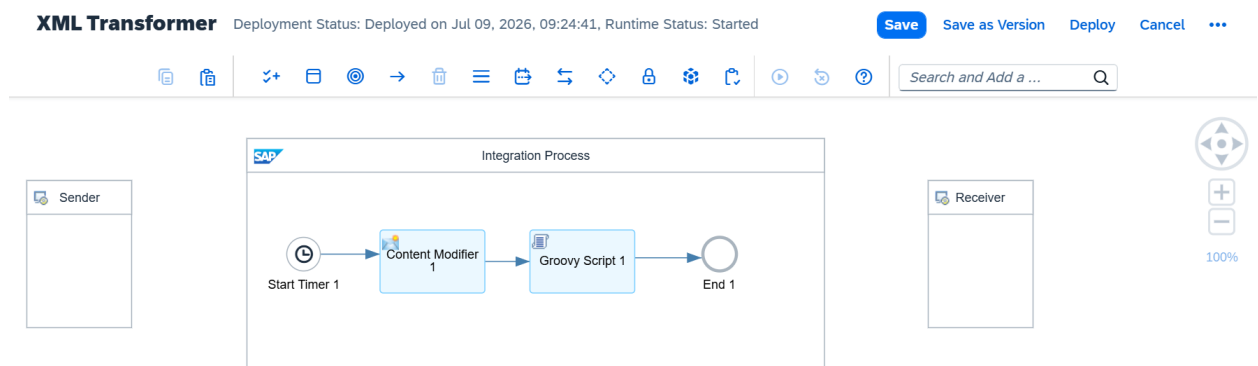

Figure 1: Timer -> Content Modifier -> Groovy Script -> End

Sample Input XML

```
<Order>
<Item><Name>Laptop</Name><Price>60000</Price></Item>
<Item><Name>Mouse</Name><Price>1000</Price></Item>
<Item><Name>Phone</Name><Price>80000</Price></Item>
</Order>
```

Complete Groovy Script

```
import com.sap.gateway.ip.core.customdev.util.Message
import groovy.util.XmlSlurper
import groovy.xml.MarkupBuilder

def Message processData(Message message) {

    def log = messageLogFactory.getMessageLog(message)

    try {

        def body = message.getBody(String)
```

```

log?.addAttachmentAsString("Input XML", body, "application/xml")

def order = new XmlSlurper().parseText(body)

def total = 0

def writer = new StringWriter()
def xml = new MarkupBuilder(writer)

xml.Order {

    order.Item.each { item ->

        def name = item.Name.text()
        def price = item.Price.text().toDouble()

        def finalPrice = price
        def discountApplied = false

        if (price > 50000) {
            finalPrice = price * 0.9
            discountApplied = true
        }

        total += finalPrice

        Item {
            Name(name)
            Price(String.format("%.2f", price))
            FinalPrice(String.format("%.2f", finalPrice))
            DiscountApplied(discountApplied)
        }

        Total(String.format("%.2f", total))
    }

    def output = writer.toString()

    log?.addAttachmentAsString("Output XML", output, "application/xml")

    message.setBody(output)

} catch (Exception e) {

    log?.addAttachmentAsString("Error", e.getMessage(), "text/plain")
    throw e

}

return message
}

```

Business Logic

- Parse XML using XmlSlurper
- Loop through Items
- Apply 10% discount above ₹50,000
- Add FinalPrice and DiscountApplied

- Recalculate Total
- Rebuild XML using MarkupBuilder
- Log Input and Output XML

Execution Result

XML Transformer

Input XML
Output XML

```

<Order>
  <Item>
    <Name>Laptop</Name>
    <Price>60000.00</Price>
    <FinalPrice>54000.00</FinalPrice>
    <DiscountApplied>true</DiscountApplied>
  </Item>
  <Item>
    <Name>Mouse</Name>
    <Price>1000.00</Price>
    <FinalPrice>1000.00</FinalPrice>
    <DiscountApplied>false</DiscountApplied>
  </Item>

```

Figure 2: Successfully executed iFlow showing transformed XML output.

Expected Output

```

<Order>
  <Item>
    <Name>Laptop</Name>
    <Price>60000.00</Price>
    <FinalPrice>54000.00</FinalPrice>
    <DiscountApplied>true</DiscountApplied>
  </Item>
  <Total>127000.00</Total>
</Order>

```

Concepts Covered

XmlSlurper
 MarkupBuilder
 Business Rules
 XML Transformation

Groovy Scripting

Logging

Exception Handling
